Download driver printer matrix point mp 7645 12 . 955771916 How can i read this text please Help me A: In the original post you have this:  $\$i=1; \$r=0; \text{foreach}(\$array \text{ as } \$k \Rightarrow \&\$v) \{ \text{if}(\$k == 1 \parallel \$k == 2 \parallel \$k == 3 \parallel \$k == 4) \{ \$i++; \text{if}(\$i \% 10 == 0) \{ \$r++; \$i = 1; \} \}$  What you want is to change that to this:  $\$i = 1; \text{foreach}(\$array \text{ as } \$k \Rightarrow \&\$v) \{ \text{if}(\$k == 1 \parallel \$k == 2 \parallel \$k == 3 \parallel \$k == 4) \{ \$i++; \text{if}(\$i \% 10 == 0) \{ \$r++; \$i = 1; \} \}$  As @Sajeel stated above, removing the & from the v after the assignment will remove that error. The use of the  $\$V\$$  data for the definition of the geocentric frame, this allows to avoid the binning in latitude of the  $\$V\$$  data (see below), to determine the position of the nodes correctly and to evaluate the extended transits. This way, we evaluate the potential uncertainties due to the choice of different reference system. However, this choice also allows us to reduce the  $\$V\$$  time resolution to 24 hr. We fitted the curves of  $(T_{\text{pen}} + T_{\text{orb}})/2$  between the first transit and the second and the third transit and subtracted them from the  $\$V\$$  photometry, keeping the remainder part of the detrended curve. Then, we defined the epoch of the first transit as the midpoint between the two local minima of the fitted  $T_{\text{pen}} + T_{\text{orb}}$  curve and the epoch of f678ea9f9e
